

## Cape Fear River Basin Ambient Monitoring System Report

January 1, 2004 through December 31, 2008

## TABLE OF CONTENTS

<b>EXECUTIVE SUMMARY.....</b>	<b>5</b>
<b>INTRODUCTION.....</b>	<b>11</b>
<i>Discharger-Led Monitoring Coalitions.....</i>	<i>11</i>
<b>PARAMETERS.....</b>	<b>17</b>
<i>Dissolved Oxygen.....</i>	<i>17</i>
<i>pH.....</i>	<i>17</i>
<i>Specific Conductance.....</i>	<i>18</i>
<i>Turbidity.....</i>	<i>18</i>
<i>Nutrients.....</i>	<i>18</i>
<i>Fecal Coliform Bacteria.....</i>	<i>18</i>
<b>WATER QUALITY MONITORING RESULTS SUMMARY .....</b>	<b>20</b>
<b>ASSESSMENT AND INTERPRETATION METHODS .....</b>	<b>36</b>
<i>Assessment Considerations .....</i>	<i>36</i>
<i>Providing Confidence in the Exceedance of Water Quality Standards .....</i>	<i>36</i>
<i>Methods Used to Summarize Results.....</i>	<i>38</i>
<i>Box and Whisker Plots .....</i>	<i>38</i>
<i>Scatter Plots – Change Over Time .....</i>	<i>39</i>
<i>Maps.....</i>	<i>40</i>
<b>WATER QUALITY ANALYSIS .....</b>	<b>41</b>
<i>Comparing Hydrologic Regions.....</i>	<i>41</i>
<i>Comparing Agencies .....</i>	<i>43</i>
<i>10-Year Trends.....</i>	<i>43</i>
<i>Geographic Assessment.....</i>	<i>45</i>
<i>Significant Issues.....</i>	<i>49</i>

### Evaluation Levels

In order to assist the reader in developing a rapid understanding of the summary statistics provided throughout this data review, concentrations of water quality variables may be compared to an Evaluation Level (EL). Evaluation levels may be a water quality standard, an action level, an ecological threshold, or simply an arbitrary threshold that facilitates a rapid data review. Evaluation levels are further examined for frequency to determine if they have been exceeded in more than 10 percent of the observed samples. This summary approach facilitates a rapid and straightforward presentation of the data but may not be appropriate for making specific use support decisions necessary for identification of impaired waters under the Clean Water Act's requirements for 303(d) listings. The reader is advised to review the states 303(d) listing methodology for this purpose. (see [http://h2o.enr.state.nc.us/tmdl/General\\_303d.htm](http://h2o.enr.state.nc.us/tmdl/General_303d.htm)).

## EXECUTIVE SUMMARY

A general understanding of human activities and natural forces that affect pollution loads and their potential impacts on water quality can be obtained through routine sampling from fixed water quality monitoring stations. During this assessment period (January 1, 2004 through December 31, 2008) chemical and physical measurements were obtained by the Division of Water Quality (DWQ) from 73 stations located throughout the Cape Fear River Basin.

In addition to the 73 sites monitored by DWQ, there are 124 sites in the basin that are monitored by discharger coalitions. Twenty-eight of these sites are monitored by both DWQ and the discharger coalitions, which allows for comparison of results. Based on the results nearly all parameters are comparable, with the exception of fecal coliform. This may be due to differences in holding times or perhaps differences in flow or runoff on sampling days.

In order to evaluate acceptable water quality criteria at least 10 observations are desired. If at least 10 results were collected for a given site for a given parameter, the results are then compared to water quality evaluation levels. The water quality evaluation level may be an ecological evaluation level, a narrative or a numeric standard. If less than 10 results were collected, then no comparison to evaluation levels was made. When more than 10 percent of the results exceeded the evaluation level (10% criteria), a binomial statistical test was employed to determine how much statistical confidence there is that the results statistically exceed the 10% criteria. If at least 95% confidence was found that a 10% exceedance occurred, then that is termed a statistically significant exceedance (SSE). This method was applied for all parameters with an evaluation level, except for fecal coliform bacteria, which uses a 20% criteria in most waters as well as a geometric mean criteria. See page 18 for an explanation of fecal coliform methods. The results of the data analysis are displayed in tables, box plots, scatter plots, and maps. For complete summaries on each station, reference the AMS Station Summary Sheets located in Appendix A.

Ninety-nine sites did not have any 10% exceedances. A total of 43 locations were found with SSEs. Nine of these were found to have more than one SSE. SSEs were found for pH at 20 sites, for fecal coliform screening at 17 sites, for dissolved oxygen at 13 sites, for turbidity at three sites, for chlorophyll a at two sites, for total nitrates and nitrites at one site, and chloride at one site. Twenty-nine sites with 10% exceedances did not rise to the level of SSEs.

**Table 1** summarizes areas of potential concern in the Cape Fear River Basin using these criteria. While reading the table please note the following: The majority of the parameters listed are compared directly to their standards. There is one exception, however. The fecal coliform standard requires that five samples be taken in the span of 30 days, which was not done for the ambient data. Therefore the review of fecal coliform ambient data should be used for screening only. A summary of the evaluation level data is included as **Figure 1**.

Analysis of long term trends (ten years) reveals generally improving trends in water quality in the Deep River and Haw River Hydrologic Units (HUs) based on improving ammonia concentrations and fecal coliform counts among other parameters. Conversely, the other four HUs in the basin were found to have generally worsening water quality. The strongest indicator of changing water quality in these trends was fecal coliform; five of the six HUs were found to have statistically significant trends in fecal coliform counts. Note that this analysis only includes river data, not lake sampling data.

Geographically, there are three urban areas that appear to have to have issues: Durham, Fayetteville, and Wilmington. New Hope Creek and Northeast Creek in Durham each have multiple issues with chlorophyll a, pH, turbidity, dissolved oxygen, and fecal coliform. In Fayetteville, there are issues with fecal coliform and dissolved oxygen. In the Wilmington area there are concerns with pH, dissolved oxygen, and turbidity. Urban areas often have multiple sources of issues, including wastewater treatment plants, stormwater runoff, and lack of adequate vegetative buffers around stream.

For a stretch of the Cape Fear River from Navassa to Channel Marker 61 in Wilmington, low dissolved oxygen is an issue of note. The Cape Fear River in this area is not classified as swamp. But in this stretch are the mouths of the Black River and the Northeast Cape Fear River. Both of those river systems contain large areas of swamp. Seven stations in this stretch of the Cape Fear have SSEs for dissolved oxygen. The low dissolved oxygen of the Wilmington area Cape Fear stations may be related to the influx of swamp water and other issues.

Note that although nutrient concentrations were assessed in this document, no loading analysis was done. Flow effects and drought impacts also were not assessed.

**Figure 1. A Summary of Concerns**

## INTRODUCTION

The DWQ's Ambient Monitoring System (AMS) is a network of stream, lake, and estuarine stations strategically located for the collection of physical and chemical water quality data. The stations are located at convenient access points (e.g. bridge crossings) that are sampled on a monthly basis. These locations were chosen to characterize the effects of point source dischargers and nonpoint sources such as agriculture, animal operations, and urbanization within watersheds.

The data are used to identify long term trends within watersheds, to develop Total Maximum Daily Loads (TMDLs) and to compare measured values with water quality standards to identify possible areas of impairment. Parametric coverage is determined by freshwater or saltwater waterbody classification and corresponding water quality standards. Under this arrangement, core parameters are based on Class C waters with additional parameters added when justified (**Table 2**).

Within this document, an analysis of how monitoring results compare with water quality standards and evaluation levels is presented. An educational and conceptual overview of water quality standards is provided at: <http://www.epa.gov/waterscience/standards>. Specific information on North Carolina water quality standards is provided at: <http://h2o.enr.state.nc.us/csu/swstdsfaq.html>. A summary of selected water quality standards are listed in **Table 3**.

Water quality data are evaluated in five year periods. Some stations have little or no data for several parameters over the period. However, for the purpose of standardization, data summaries for each station are included in this report. DWQ monitored water quality and collected samples at 73 stations in the basin throughout the assessment period. The locations of the sampling sites are illustrated in **Figure 2**, and listed in **Table 4**.

In January 2007 the DWQ began collection of samples from a series of randomly determined sites. A description of the Random Sampling Program can be found here: <http://h2o.enr.state.nc.us/esb/rams.html>. There are currently four random sites located in the Cape Fear River Basin. Because this report assesses in a five-year window and RAMS stations will only have 2 years of data, they are not included in the ambient report. Once a sufficient number of samples have been collected statewide, RAMS data will be discussed in a separate report.

### **Discharger-Led Monitoring Coalitions**

Also within the Cape Fear River basin are monitoring stations maintained by discharger-led monitoring coalitions. There are three such coalitions operating in the basin, the Upper Cape Fear River Basin Association (UCFRBA), the Middle Cape Fear River Basin Association (MCFRBA), and the Lower Cape Fear River Program (LCFRP). Each contains a coalition of municipalities and industries that release treated wastewater into the Cape Fear River basin. These three coalitions began operation in 2000, 1998 and 1996, respectively. Like other discharger coalitions, the Cape Fear coalitions have taken an active role in monitoring water quality. The North Carolina coalition program provides an alternative to individual in-stream National Pollutant Discharge Elimination System (NPDES) permit monitoring requirements. The members of the Cape Fear coalitions collected water samples from 124 monitoring stations throughout the basin under agreement with DWQ. 28 of the stations monitored by Cape Fear coalitions are also monitored by DWQ. The locations of the coalition sampling sites are also illustrated in **Figure 2**, and listed in **Table 4**. Participation in the North Carolina coalition program does not affect effluent sampling requirements.

**Table 2. Parametric coverage for the Ambient Monitoring System.**

Parameter
Dissolved oxygen (s)
pH (s)
Specific conductance
Temperature (s)
Total phosphorus
Ammonia as N
Total Kjeldahl as N
Nitrate+nitrite as N (s)
Total suspended solids
Turbidity (s)
Fecal coliform bacteria (s)
Chlorophyll a (s)

Notes:

An 's' indicates the parameter has a standard.

Chlorophyll a and nutrient sampling is only done in areas of concern, such as NSW, estuaries, lakes, and areas with known enrichment issues.

**Table 3. Selected water quality standards**

Parameter	Standards for All Freshwater			Standards to Support Additional Uses		
	Aquatic Life	Human Health	Water Supply Classifications	Trout Water	HQW	Swamp Waters
Chloride (mg/l)	230		250			
Chlorophyll a (ug/L)	40 <sup>2</sup>			15 <sup>2</sup>		
Coliform, total (MFTCC/100 ml) <sup>3</sup>			50 <sup>2</sup> (WS-I only)			
Coliform, fecal (MFFCC/100 ml) <sup>4</sup>		200 <sup>2</sup>				
Dissolved oxygen (mg/L)	4.0 <sup>5,6</sup>			6.0		2, 6
Hardness, total (mg/L)			100			
Nitrate nitrogen (mg/L)			10			
pH (units)	6.0 - 9.0 <sup>2,6</sup>					2, 6
Solids, total suspended (mg/L)				10 Trout, 20 other <sup>7</sup>		
Turbidity (NTU)	50, 25 <sup>2</sup>			10 <sup>2</sup>		

Notes:

Standards apply to all classifications. For the protection of water supply and supplemental classifications, standards listed under Standards to Support Additional Uses should be used unless standards for aquatic life or human health are listed and are more stringent. Standards are the same for all water supply classifications (Administrative Code 15A NCAC 2B 0200, eff. August 1, 2004).

<sup>2</sup>Refer to 2B.0211 for narrative description of limits.

<sup>3</sup>Membrane filter total coliform count per 100 ml of sample.

<sup>4</sup>Membrane filter fecal coliform count per 100 ml of sample.

<sup>5</sup>An instantaneous reading may be as low as 4.0 mg/L, but the daily average must be 5.0 mg/L or more.

<sup>6</sup>Designated swamp waters may have a dissolved oxygen less than 5.0 mg/L and a pH as low as 4.3, if due to natural conditions.

<sup>7</sup>For effluent limits only, refer to 2B.0224(1)(b)(ii).

Parameter ( $\mu\text{g/L}$ , unless noted)	Standards for All Saltwater			Standards To Support Additional Uses	
	Aquatic Life	Human Health <sup>1</sup>	Class SA <sup>2</sup>	HQW	Swamp Waters
Chlorophyll a (corrected)	40 <sup>3</sup>				
Coliform, fecal (MFFCC/100ml) <sup>4</sup>		200 <sup>3</sup>	14 <sup>3</sup>		
Dissolved oxygen (mg/L)	5.0 <sup>8</sup>			6.0	3, 5
PH (units)	6.8 - 8.5 <sup>5</sup>				3, 5
Solids, total suspended (mg/L)				10 PNA <sup>6</sup> , 20 other <sup>7</sup>	
Turbidity (NTU)	25 <sup>3</sup>				

<sup>1</sup>Standards are based on consumption of fish only unless dermal contact studies are available, see 2B.0208 for equation.

<sup>2</sup>Class SA = shellfishing waters, see 2B.0101 for description.

<sup>3</sup>See 2B.0220 for narrative description of limits.

<sup>4</sup>MFFCC/100ml means membrane filter fecal coliform count per 100 ml of sample.

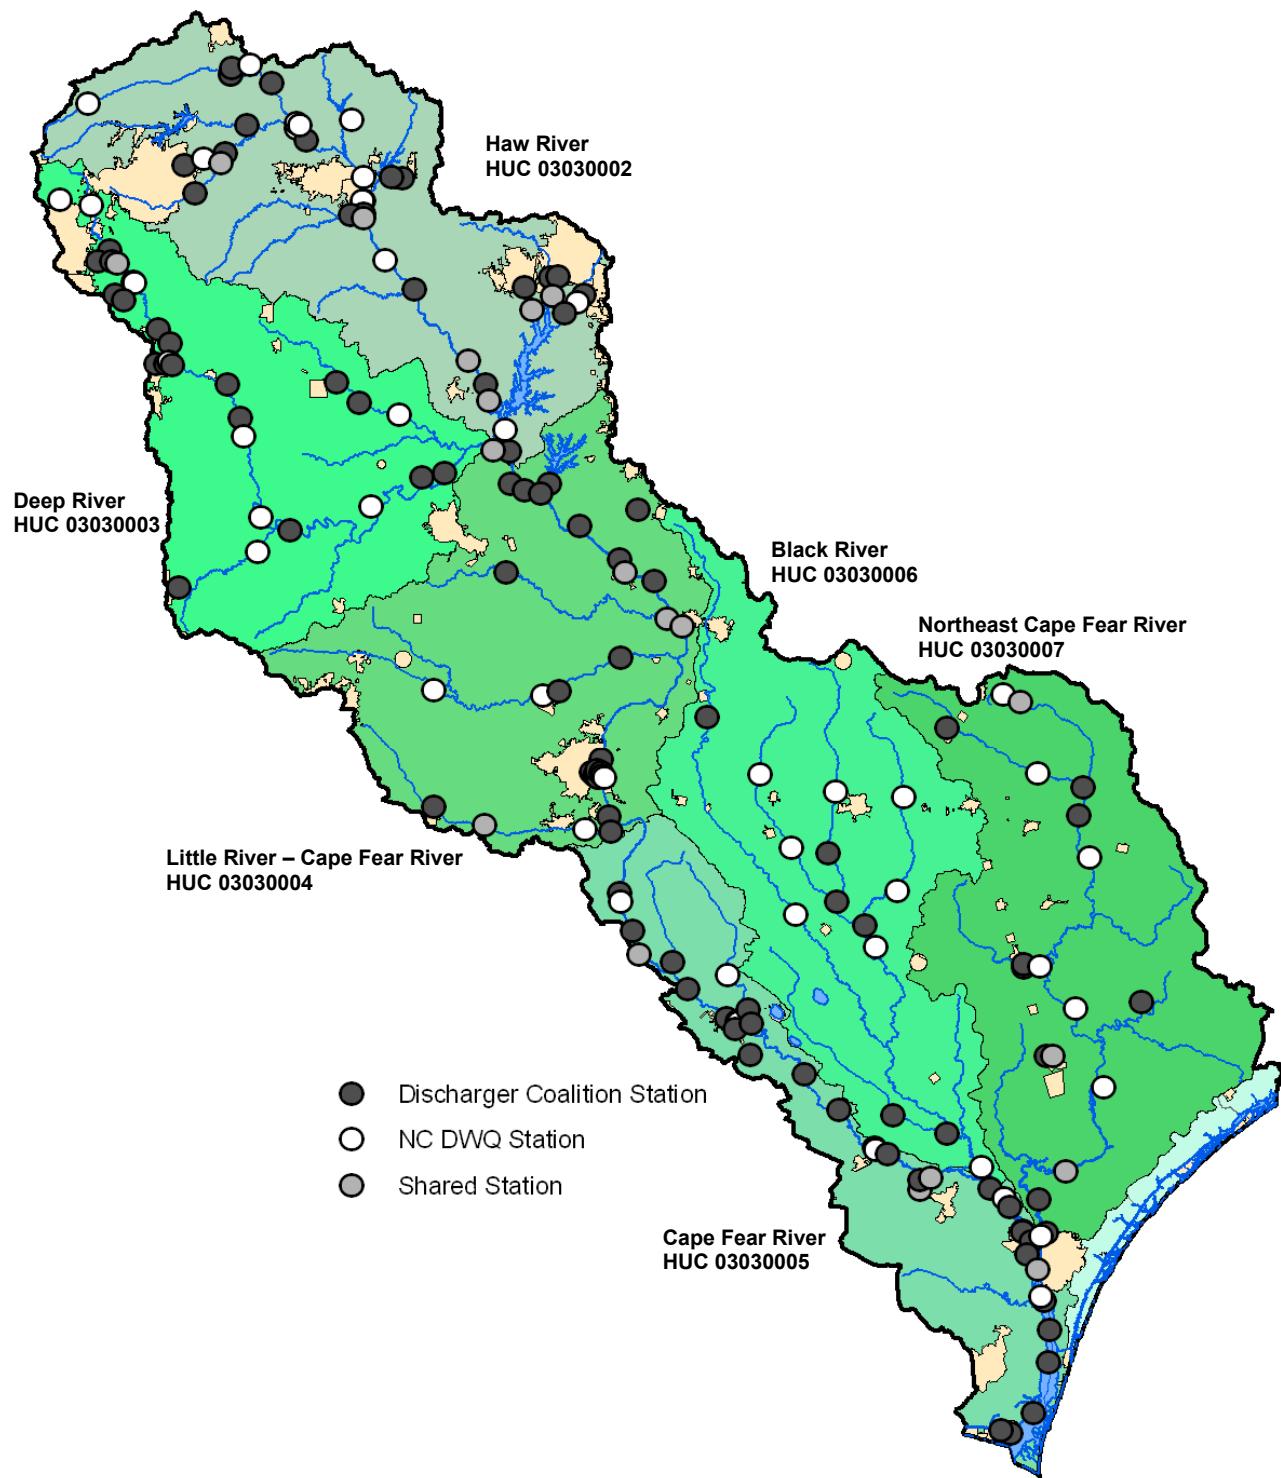

<sup>5</sup>Designated swamp waters may have a dissolved oxygen less than 5.0 mg/L and a pH as low as 4.3 s.u., if due to natural conditions.

<sup>6</sup>PNA = Primary Nursery Areas.

<sup>7</sup>For effluent limits only, see 2B.0224.

<sup>8</sup>Swamp waters, poorly flushed tidally influenced streams, or embayments, or estuarine bottom waters may have lower values if caused by natural conditions.

## PARAMETERS

### Dissolved Oxygen

Dissolved oxygen is one of the most important of all the chemical measurements. Dissolved oxygen provides valuable information about the ability of the water to support aquatic life and the capacity of water to assimilate point and nonpoint discharges. Water quality standards for dissolved oxygen vary depending on the classification of the body of water. For freshwaters, 15A NCAC 02B .0211 (3)(b) specifies:

*Dissolved oxygen: not less than 6.0 mg/l for trout waters; for non-trout waters, not less than a daily average of 5.0 mg/l with a minimum instantaneous value of not less than 4.0 mg/l; swamp waters, lake coves or backwaters, and lake bottom waters may have lower values if caused by natural conditions.*

For saltwaters, 15A NCAC 02B .0220 (3)(b) applies instead:

*Dissolved oxygen: not less than 5.0 mg/l, except that swamp waters, poorly flushed tidally influenced streams or embayments, or estuarine bottom waters may have lower values if caused by natural conditions.*

### pH

The pH of natural waters can vary throughout the state. Low values, such as less than 7.0 Standard Units (SU), can be found in waters rich in dissolved organic matter, such as swamp lands. High values, such as greater than 7.0 SU may

be found during algal blooms. Point source dischargers can also influence the pH of a stream. The measurement of pH is relatively easy; however the accuracy of field measurements is limited by the abilities of the field equipment, which is generally accurate to within 0.2 SU. This is due, in part, because the scale for measuring pH is logarithmic (i.e. a pH of 8 is ten times less concentrated in hydrogen ions than a pH of 7). The water quality standards for pH in freshwaters consider values less than 6.0 SU or greater than 9.0 SU to warrant attention. In swamp waters, a pH below 4.3 SU is of concern. For saltwaters, the acceptable range is more strict: 6.8 SU to 8.5 SU.

## **Specific Conductance**

In this report, conductivity is synonymous with specific conductance. It is reported in micro-mhos per centimeter ( $\mu\text{mhos}/\text{cm}$ ) at 25°C. Conductivity is a measure of the ability of water to conduct an electric current. The presence of ions and temperature are major factors in the ability of water to conduct a current. Clean freshwater has a low conductivity, whereas high conductivities may indicate polluted water or saline conditions. Measurements reported are corrected for temperature, thus the range of values reported over a period of time indicate the relative presence of ions in water. North Carolina freshwater streams have a natural conductance range of 17-65  $\mu\text{mhos}/\text{cm}$  (USGS 1992).

Conductivity can be used to evaluate variations in dissolved mineral concentrations (ions) among sites with varying degrees of impact resulting from point source discharges. Generally, impacted sites show elevated and widely ranging values for conductivity. Water bodies that contain saltwater will also have high conductivities. Therefore salinity must be accounted for prior to using conductivity as an indicator for problems.

## **Turbidity**

Turbidity data may denote episodic high values on particular dates or within narrow time periods. These can often be the result of intense or sustained rainfall events; however elevated values can occur at other times. In coastal areas, tidal surges can also disturb shallow estuarine sediments and naturally increase turbidity.

## **Nutrients**

Compounds of nitrogen and phosphorus are major components of living organisms and thus are essential to maintain life. These compounds are collectively referred to as "nutrients." Nitrogen compounds include ammonia-nitrogen ( $\text{NH}_3\text{-N}$ ), total Kjeldahl nitrogen (TKN) and nitrite+nitrate nitrogen ( $\text{NO}_2+\text{NO}_3\text{-N}$ ). Phosphorus is measured as total phosphorus. When nutrients are introduced to an aquatic ecosystem from municipal and industrial treatment processes, or runoff from urban or agricultural land, the excessive growth of algae (algal blooms) and other plants may be accelerated.

At neutral pH in water, ammonia normally forms an ionized solution of ammonium hydroxide, with a small amount of deionized ammonia. However, as pH increases, more ammonia is left deionized. Deionized ammonia is toxic to fish and other aquatic organisms.

## **Fecal Coliform Bacteria**

Concentrations of fecal coliform bacteria can vary greatly. The descriptive statistics used to evaluate fecal coliform bacteria data include the geometric mean and the median depending on the classification of the waterbody. For all freshwater sites in the Cape Fear River Basin, the standard specified in Administrative Code 15A NCAC 02B.0211 (3)(e) (May 1, 2007) is applicable:

*"Organisms of the coliform group: fecal coliforms shall not exceed a geometric mean of 200/100ml (MF count) based upon at least five consecutive samples examined during any 30 day period, nor exceed 400/100ml in more than 20 percent of the samples examined during such period. Violations of the fecal coliform standard are expected during rainfall events and, in some cases, this violation is expected to be caused by uncontrollable nonpoint source pollution. All coliform concentrations are to be analyzed using the membrane filter technique unless high turbidity or other*

*adverse conditions necessitate the tube dilution method; in case of controversy over results, the MPN 5-tube dilution technique shall be used as the reference method."*

For waters where commercial shellfishing is done (Class SA), an additional water quality standard is applied (15A NCAC 02B .0221 (3)(d) (May 1, 2007):

*Organisms of coliform group: fecal coliform group not to exceed a median MF of 14/100 ml and not more than 10 percent of the samples shall exceed an MF count of 43/100 ml in those areas most probably exposed to fecal contamination during the most unfavorable hydrographic and pollution conditions.*

Class SA, non-SA tidal saltwaters, and fresh waters are present in the Cape Fear River basin. All sites where the geometric mean was greater than 200 colonies/100ml, or where greater than 20 percent of the results exceed 400 colonies/100ml (i.e. all sites that exceed the evaluation level) are indicated on the respective station summary sheets. In addition, class SA sites where the median exceeds 14 colonies/100ml or where greater than 10 percent of the results exceed 43 colonies/100ml are indicated on the sheets.

Fecal coliform problems are screened using annual summaries of Ambient sampling results. If the screening indicates that the station may be in violation of the standard, the standard is assessed using the method required by law. All such class B, class SB, and class SA waters are assessed, and other waters as resources permit. The required assessment method is known as "5 in 30", collecting a minimum five samples within a span of 30 days. If a water body exceeds the standard more than 20% of the time during the 30-day period or the geomean for the 30-day period is greater than 200, then that water body is considered impaired and is added to the impaired water list, the 303(d) list.

In addition, for all tidal salt waters, the following is applicable 15A NCAC 02B .0220 (3)(e) (May 1, 2007):

*Enterococcus, including Enterococcus faecalis, Enterococcus faecium, Enterococcus avium, and Enterococcus gallinarium: not to exceed a geometric mean of 35 enterococci per 100 ml based upon a minimum of five samples within any consecutive 30 days.*

DWQ and the discharger coalitions do not collect Enterococcus samples. The N.C. Recreational Water Quality Program (NCRWQP) collects enterococcus samples. Their mission is to protect the public health by monitoring the quality of N.C.'s coastal recreational waters and notifying the public when bacteriological standards for safe bodily contact are exceeded. The coastal waters monitored include the ocean beaches, sounds, bays and estuarine rivers.

Enterococcus bacteria is an indicator organism found in the intestines of warm-blooded animals. While it may not cause illness itself, its presence is correlated with that of organisms that can cause illness. The program tests 239 ocean and sound-side areas. Swimming season begins on April 1<sup>st</sup> and ends Sept. 30<sup>th</sup>. All ocean beaches and high-use sound-side beaches (Tier 1) are tested weekly. Lower-use beaches (Tier 2 and Tier 3) are tested twice a month. All sites are tested twice a month in October and monthly from November through March. The NCRWQP currently uses single sample test to determine compliance with their rules (15A NCAC 18A .3402):

- (a) *The Enterococcus level in a Tier I swimming area shall not exceed either:*
  - (1) *A geometric mean of 35 enterococci per 100 milliliter of water, that includes a minimum of at least five samples collected within 30 days; or*
  - (2) *A single sample of 104 enterococci per 100 milliliter of water.*
- (b) *The enterococcus level in a tier II swimming area shall not exceed a single sample of 276 enterococci per 100 milliliter of water.*
- (c) *The enterococcus level in a tier III swimming area shall not exceed two consecutive samples of 500 enterococci per 100 milliliter of water"*

The results of their sampling can be found on their website:

[http://www.deh.enr.state.nc.us/shellfish/Water\\_Monitoring/RWQweb/home.htm](http://www.deh.enr.state.nc.us/shellfish/Water_Monitoring/RWQweb/home.htm)

## WATER QUALITY MONITORING RESULTS SUMMARY

Water Quality within the basin during the evaluation period is summarized in the following tables. **Table 5** shows how often water quality evaluation levels were exceeded. **Table 6** shows average values, for comparison against Hydrologic Unit (HU) and basinwide averages. By comparing individual stations against averages for the HU and for the entire basin, it is possible to pick out stations that are significantly higher or lower. Comparing HUs to each other and to the Basinwide average allows for broader comparison.

Notes:

NS: No Standard exists for this parameter in this stream class.

NC: Samples for this parameter were Not Collected.

L10: Less than 10 samples were collected for this parameter, therefore the results were not assessed.

1: In trout waters, a dissolved oxygen standard of 6 mg/L applies.

Notes: Empty rows indicate that no samples were collected for that parameter at that station.

The means displayed in this table are arithmetic means, except for fecal coliform, which is a geometric mean.

## ASSESSMENT AND INTERPRETATION METHODS

Monitoring and sampling results considered in this report represent samples collected or measurements taken at less than one-meter depth.

Percentile statistics were calculated for most of the data using JMP statistical software (version 5.01; SAS Institute, Cary, NC). Values less than the minimum reporting level (non-detects) were evaluated as equal to the reporting level. Box and whisker plots (constructed using SigmaPlot version 9) and maps are presented for most water quality parameters collected at each monitoring station. Significant trends in water quality parameters (constructed using Microsoft Excel) are illustrated as scatterplots. Significant trends are found by assessing the probability that the linear model explains the data no better than chance. If that chance is 5% or less (an observed significance probability of 0.05 or less) then that is considered evidence of a regression effect in this document. The strength of the regression effect is given as an  $r^2$  value, the portion of the data that is explained by the linear model. There are many other types of modeling (non-linear) that can be used to explore trends, but they were not used in this document.

### **Assessment Considerations**

#### Total Metals

The North Carolina Division of Water Quality is currently reviewing water quality standards for metals. Review of historical total metals data and biological data has shown that no correlation exists between exceedance of total metals ambient standards and biological impairment. Therefore, as of May 2007 DWQ has suspended collection of total metals at AMS stations.

#### Chlorophyll a

During this assessment period the DWQ Laboratory Section noted that chlorophyll a samples collected between 4/11/05 and 8/23/05 were incorrectly prepared for analysis, to the extent that the accuracy of the results is unknown. Therefore, the chlorophyll a results for this period were omitted from the dataset.

### **Providing Confidence in the Exceedance of Water Quality Standards**

Historically, NC DWQ has used guidance provided by the US EPA for determining when the number of results that exceed a water quality standard indicate potential water quality issues. The US EPA has suggested that management actions be implemented when 10 percent of the results exceeded a water quality standard. This interpretation is the same whether 1 out of 10, or 5 out of 50, or 25 out of 250 results exceed a standard. Evaluating exceedances in this manner is termed the “raw-score” approach. Although this “10 percent exceedance criterion” defines a point where potential water quality issues may be present, it does not consider uncertainty. Some results are subject to chance or other factors such as calibration errors or sample mishandling. Uncertainty levels change with sample size. The smaller the sample size, the greater the uncertainty.

This document uses a nonparametric procedure (Lin *et al.* 2000) to identify when a sufficient number of exceedances have occurred that indicate a true exceedance probability of 10 percent. Calculating the minimum number of exceedances needed for a particular sample size was done using the BINOMDIST function in Microsoft Excel®. This statistical function suggests that at least three exceedances need to be observed in a sample of 10 in order to be [about] 95 percent confident that the results statistically exceed the water quality standard more than 10% of the time. For example, there is less statistical confidence associated with a 1 exceedance out of 10 (74 percent) than when there are 3 exceedances out of 10 (99 percent confidence) (**Table 7**).

**Table 7. Exceedance Confidence**

Number of Samples	Number of Exceedances																	
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17

Note: Bold entries indicate that there is at least 95% confidence that at least 10% of the possible samples exceed the evaluation level.

## **Methods Used to Summarize Results**

Methods used to summarize the results in this report encompass both tabular and graphical formats. Box and whisker plots, scatterplots, and maps were used to depict data for a variety of water quality parameters throughout the basin. For the box plots, stations with fewer than 10 data points for a given parameter were not included. This occasionally occurred when a new station was added, an old station was removed, or a station was moved to a new location in the basin.

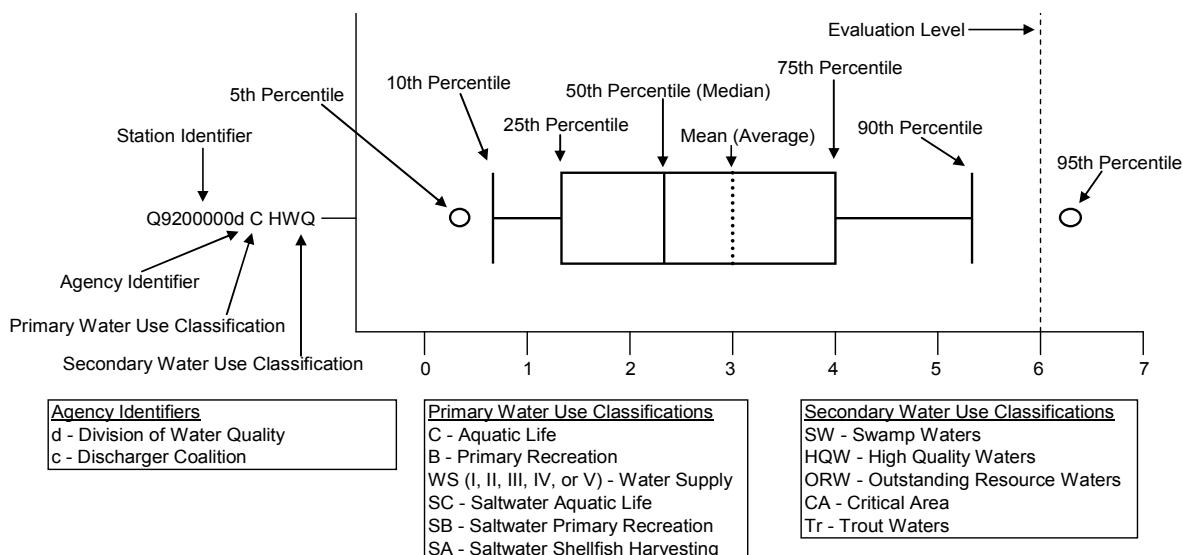

Individual station summary sheets provide details on station location, stream classification, along with specifics on what parameters were measured, the number of samples taken (i.e. sample size), the number of results below reporting levels, the number of results exceeding a water quality standard or evaluation level, statistical confidence that 10% of results exceeded the evaluation level, and a general overview of the distribution of the results using percentiles. These station summary sheets provide the greatest details on a station-by-station basis. They are included as **Appendix A** to this report.

The results were depicted in the following ways:

- Comparing stations – box plots
- Assessing stations – tables
- Comparing hydrologic units – box plots
- Illustrating trends - scatterplots
- Illustrating regional variation – maps

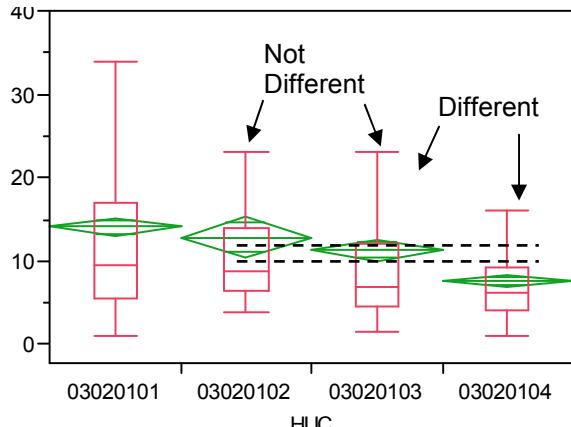

## **Box and Whisker Plots**

The primary method of analyzing data in this report is through the use of box and whisker plots. **Figure 3** is an annotated example of a box and whisker plot that illustrates the distribution of the results for a particular parameter at a single site. This box plot contains both the median and mean values. Differences between the median and mean can illustrate the distribution of the results. For example, if the mean is considerably larger than the median, then there are likely a few very high concentrations raising the mean. Another useful measure is to compare the 90<sup>th</sup> percentile against the evaluation level. For most parameters, 10% exceedance of the evaluation levels is considered a violation. Therefore the 90<sup>th</sup> (or 10<sup>th</sup> in the case of minimum evaluation levels) percentile exceeding the evaluation level is an equivalent statement.

**Figure 3. An Example Box Plot for a Station**

**Figure 4** is an example of a box and whisker plot that is comparing four HUCs for a single parameter. In this case the box plots are vertical instead of horizontal. A “mean diamond” is present on each. The center line of each diamond is the average. The short lines above and below the center are called “overlap marks” and represent a 95% confidence interval for the mean. To compare means, extend the overlap marks as shown in the figure. If the overlap mark of one diamond is closest to the mean line of another diamond then the two averages are not significantly different. If the overlap line is closer to the other diamond’s overlap mark, then they are significantly different.

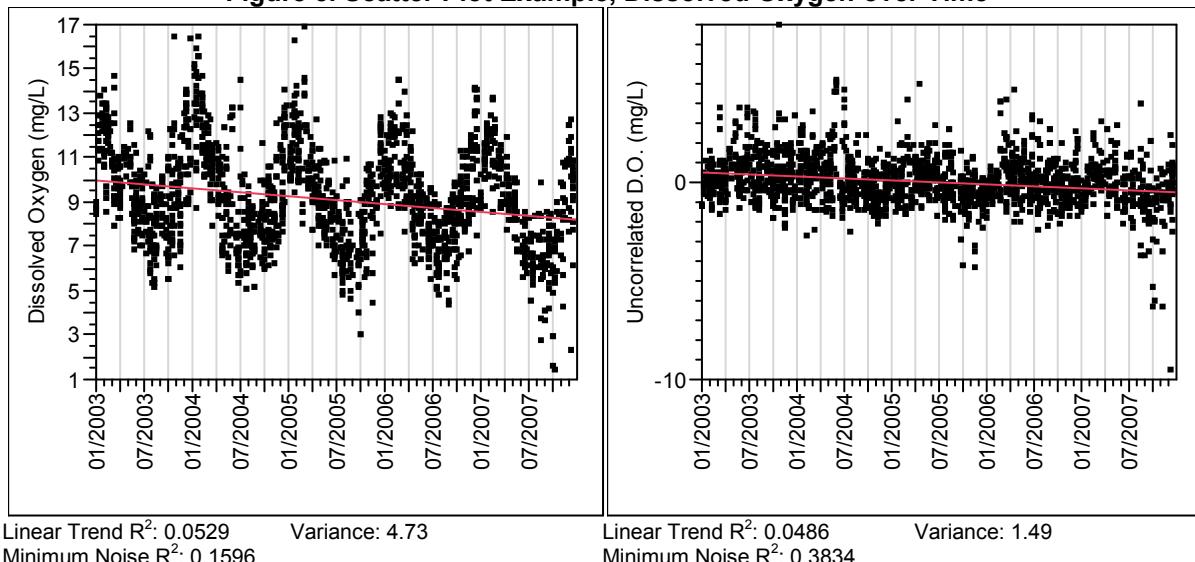

**Figure 4. A Box Plot for Comparing HUCs**

## Scatter Plots – Change Over Time

Change over time trends are illustrated in scatterplots. If there is at least 95% confidence that a particular linear trend explains the data better than chance (Prob > F of 0.05 or less) then that linear trend was included on the graph. Note that this is different from the  $r^2$ . The percentage of variance explained by the linear model ( $r^2$  value) is displayed for each trend. Occasionally other effects can give the appearance of a trend. This is most common when the number of samples is high and the correlation is small. In the example below on the right, drought events in 2005 and 2007 may be responsible for the slight trend present in the data.

**Figure 5. Scatter Plot Example, Dissolved Oxygen over Time**

In the example above, two types of change over time graphs are shown. The left graph shows raw dissolved oxygen results over time. The Linear Trend  $R^2$  value estimates how much of the variation in the results can be explained by the linear trend, in this case only about 5%. The Minimum Noise  $R^2$  is the amount of variation that definitely cannot be explained by variation over time. This is based on the variation that can be found in results from a single day, such as the variation between sites. This is likely an underestimate of noise in most cases. The greater the noise, the less likely there is a trend that has not been captured.

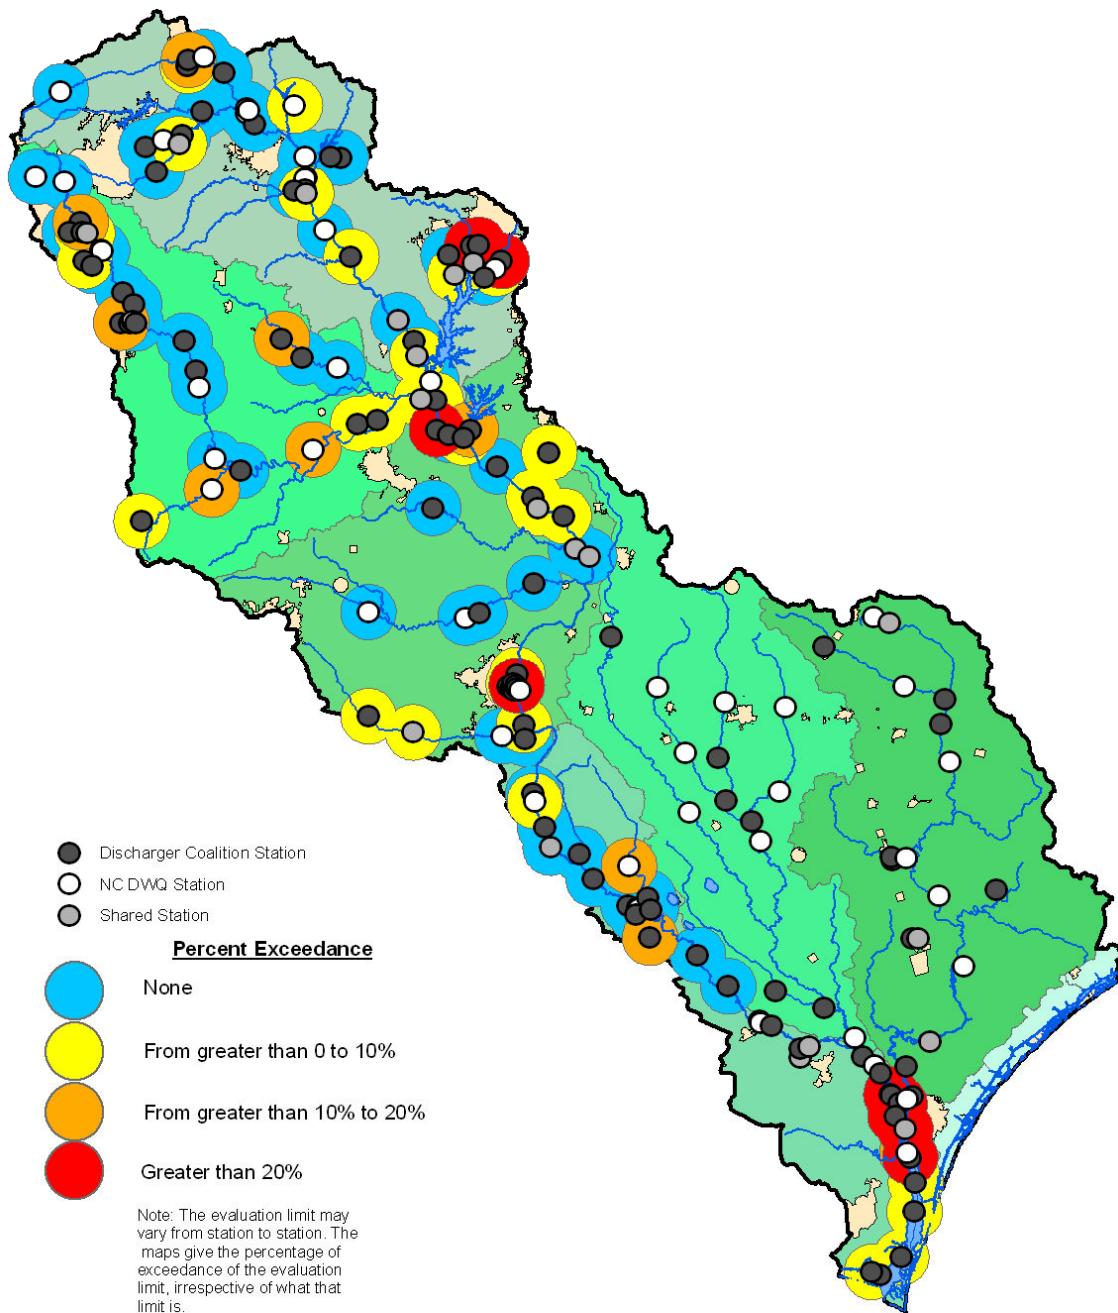

When helpful/possible, seasonal or other cyclical variation has been removed from the data via regression so that trends can be seen more easily. The graph on the left shows more variation within each year than there is between years. The variance is 4.73 mg/L. In the graph on the right, all variation that correlates to variation in water temperature

has been removed via linear regression. This reduces the variance by over half to 1.49 mg/L. Then it becomes clear visually that there are no strong temporal trends in the dissolved oxygen data that cannot be explained by changes in temperature.

## Maps

Maps are used to display data for the whole basin at once, so that the relationship of stations to each other can be seen, and regional patterns become clear. The colors signify the degree of exceedance at each location.

**Figure 6. Example Map**

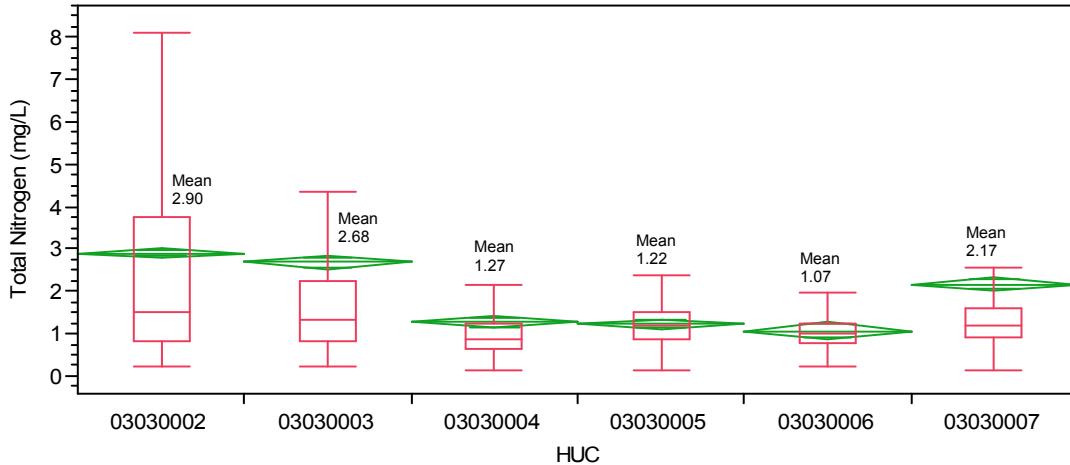

# WATER QUALITY ANALYSIS

## Comparing Hydrologic Regions

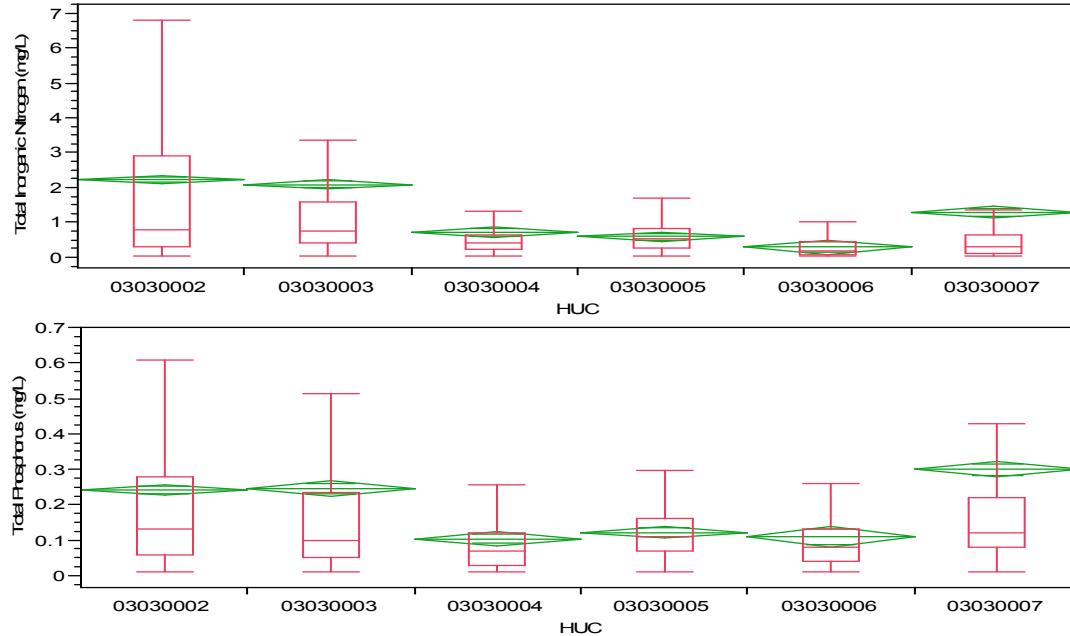

Comparisons between the six hydrologic units codes (HUCs) are illustrated with box and whisker plots. For each box plot, the data for each station in the HUC is composited. For HUC locations, refer to **Figure 2**, and **Table 4**. Refer to **Figure 3** and **Figure 4** for a description of box and whisker plots. In the following discussion, each HUC may be referred to by its last two digits, e.g. HUC 03030002 is HUC02.

**Figure 7. Total Nitrogen Concentration by HUC**

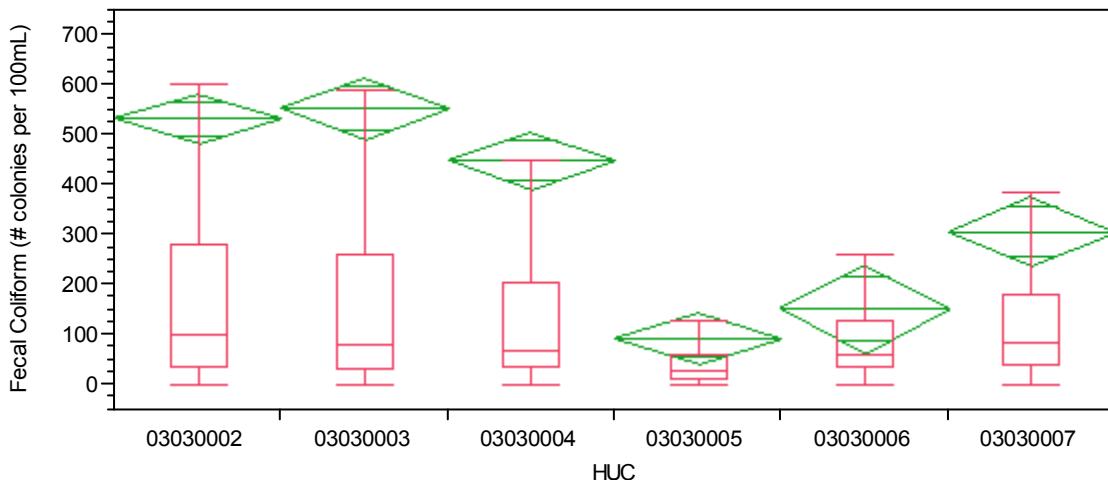

Note that for several of the HUs, the mean (green diamond) is well above the median (middle red line in the box plot). This is caused by having a few concentration spikes much higher than what is most common. Total Nitrogen means appear to be elevated in HUC02, HUC03, and HUC07 compared to the rest of the basin. Each of these three HUs includes a few stations on relatively small streams downstream of wastewater treatment plants. By the time these waters with high concentrations have reached the main stem Cape Fear River, dilution has reduced the average to that found in HUC04 and HUC05. The box plots for total phosphorus and total inorganic nitrogen look very similar (**Figure 8**).

**Figure 8. Total Inorganic Nitrogen and Total Phosphorus Concentrations by HUC**

Inorganic Nitrogen and total Phosphorus are commonly correlated with population and/or livestock centers. Nitrogen and phosphorus are ingredients in fertilizer, and are also found in wastewater effluent. Therefore agriculture, urban, and suburban areas will tend to have higher nitrogen and phosphorus concentrations than undeveloped areas. As stated before, there are several wastewater treatment plants in the Cape Fear River basin, which account for most of the high concentrations found here.

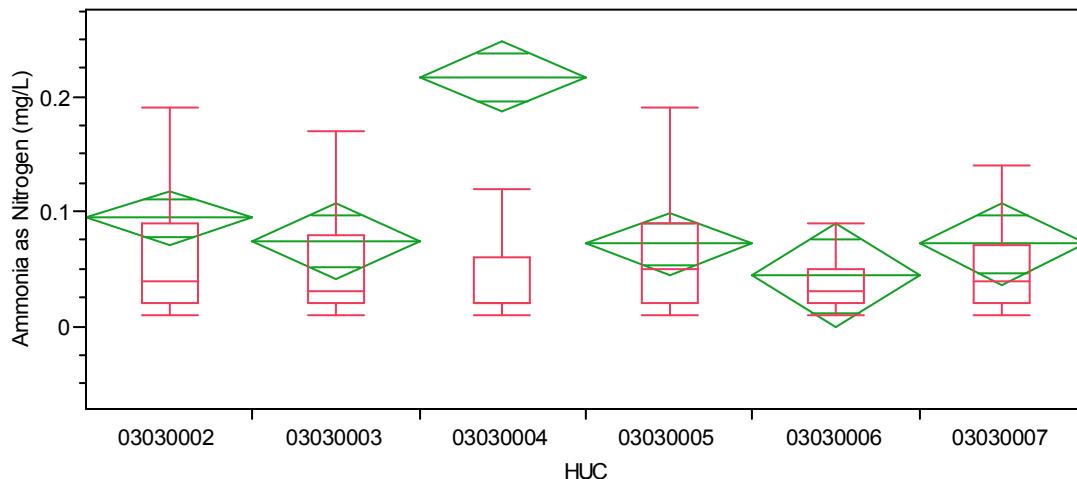

**Figure 9. Fecal Coliform by HUC**

As in **Figure 7**, for fecal coliform the averages are well above the medians. This means that there have been several very high fecal counts, which raises the average, but not enough high counts to raise the median. Fecal coliform is a highly variable parameter. High spikes of fecal coliform counts are often caused by rainfall events.

Average concentrations of fecal coliform are significantly higher in HUC02, HUC03, and HUC04. Sources of fecal coliform include surface runoff from urban areas, livestock operations, and residential areas. Sources also include sewer overflows, failed septic tanks, or malfunctioning wastewater treatment plants. Fecal coliform may also already be in the stream sediment, and be stirred up by heavy flow. Each of these HUs have large cities such as Greensboro, Durham, and Fayetteville in the drainage area. Surface runoff from these cities are likely the reason for the high averages. HUC07 is also being affected by urban runoff to a lesser extent, from smaller towns like Burgaw.

**Figure 10. Ammonia as Nitrogen by HUC**

HUC04 has an average concentration of ammonia more than twice that of the other HUs. This is entirely due to a single station B7584900, "UT to Cross Creek at Cross Creek Wastewater Treatment Plant in Fayetteville". However, this station is located upstream of the treatment plant's discharge on a small unnamed tributary, and does not appear to be impacted by the Wastewater Treatment Plant. There are no known dischargers in this stream. It may be impacted by industry in the area.

## **Comparing Agencies**

DWQ and the three discharger coalitions share 28 monitoring sites in the Cape Fear basin specifically chosen to create an opportunity to compare datasets. In order to display the data comparably, several alterations of the data were necessary. First, any month that contained more than one data point for a given site and parameter was averaged into a single monthly average. Next any month that did not have data for both DWQ and the coalitions was removed. This created a data set that was equally distributed between DWQ and the coalitions. The number of samples for comparison ranged from 968 for ammonia, to 1,604 for temperature.

Ten parameters (fecal coliform, specific conductance, turbidity, pH, dissolved oxygen, temperature, ammonia, total kjeldahl nitrogen, total nitrates and nitrites, and total phosphorus) were compared using 4 methods, the Wilcoxon test, the median test, the Van der Waerden test, and a t-test. For five of the parameters (temperature, dissolved oxygen, turbidity, total phosphorus, and total kjeldahl nitrogen) all four tests agreed that there was no significant difference between NC DWQ and coalition results. For specific conductance and ammonia, three of four tests agreed that there was no significant difference between DWQ and coalition results. Two of four tests found Total nitrates to be significantly different between DWQ and coalition results. Three tests found fecal coliform to be different, and all four agreed that pH from DWQ and the coalitions were significantly different. These results are summarized in **Table 8**.

**Table 8. Summary of Differences Between DWQ and Coalition Results**

Parameter	# Statistical Tests with No Significant Difference	# Statistical Tests with Significant Difference	Average Difference
Temperature	4	0	0.01 degrees
Dissolved Oxygen	4	0	0.16 mg/L
Turbidity	4	0	0.57 NTU
Total Kjeldahl Nitrogen	4	0	0.022 mg/L
Total Phosphorus	4	0	0.06 mg/L
Ammonia	3	1	0.042 mg/L
Specific Conductance	3	1	27 umhos/cm
Total Nitrates and Nitrites	2	2	0.45 mg/L
Fecal Coliform	1	3	242 colonies per 100 mL
pH	0	4	0.1 SU

All four tests agreed that pH was significantly different. The average difference between DWQ and coalitions was small, only 0.1 SU. Therefore this difference does not appear to represent any ecological concern, but may represent a difference in equipment brands and maintenance techniques for pH probes. Total Nitrates and Nitrites differed by an average of 0.45 mg/L, which also does not appear to be of much ecological concern, especially given that the tests were split over the significance of this.

For fecal coliform, the difference between DWQ and the coalitions appears to be large and significant, however. DWQ fecal results averaged 250, while coalitions averaged 492. Fecal coliform is a highly variable parameter. Because of this North Carolina uses the geometric mean as an assessment tool for fecal coliform. Analysis of the data log transformed, which is the same as using geometric means, came up with the same results of significant difference. When the data was analyzed on a per station basis, coalition and DWQ data was NOT significantly different. However, for all stations, the average fecal coliform count was greater for coalition results than for DWQ results. This indicates that there is some small systemic bias between DWQ and Coalition results for fecal coliform. There are many possible causes for this. One potential cause is variance in travel time from sampling to laboratory. DWQ fecal screening samples typically take longer to reach the lab, which can reduce fecal coliform counts. Other potential sources of difference are laboratory differences and sampling protocol differences. Given the natural variability of the data, both sets of data are considered accurate, but they are kept separate when assessed.

## **10-Year Trends**

Analysis of change over time was assessed using linear regression of ten years of data. The data were reduced to annual averages for each station, to make the data more manageable in scope. Linear regression was used to search for trends in the river basin as a whole, as well as in each of the six HUs.

### Trends in the Cape Fear River Basin

For the eleven parameters tested, only two were found to have statistically significant trends (a Prob > F of less than 0.05) over the whole basin, temperature and total phosphorus. Water temperature was found to be increasing at an average rate of 0.68 °C per year. Water temperature is highly correlated with air temperature, however there are no clear trends in air temperature for that period. Another potential cause could be a loss of vegetation surrounding water bodies. Total phosphorus was found to be decreasing at a rate of approximately 0.009 mg/L per year. This reduction could represent a reduction in inputs, or it may be related to flow changes. Effects caused by flow were not assessed for this report.

### Trends in the Cape Fear River Basin Hydrologic Units

Many more trends were apparent when viewed at the HU level. The following table summarizes the average rate of change (per year) for each trend.

**Table 9. Summary of Trends**

Parameter	03030002	03030003	03030004	03030005	03030006	03030007
Temperature	No Trend	No Trend	No Trend	↑ +0.147 °C	No Trend	↑+0.120 °C
Dissolved Oxygen	↑ +0.092 mg/L	↑ +0.056 mg/L	No Trend	↓ -0.048 mg/L	No Trend	No Trend
pH	↑ 0.026 mg/L	No Trend	No Trend	No Trend	No Trend	No Trend
Specific Conductance	No Trend	↓ -13.82 umhos/cm	No Trend	No Trend	↑ +3.11 umhos/cm	No Trend
Chlorophyll a	No Trend	↓ -2.31 ug/L	No Trend	No Trend	No Trend	No Trend
Fecal Coliform	↓ -34.7 col/100mL	↓ -62.65 col/100mL	↑ +32.4 col/100mL	No Trend	↑ +12.6 col/100mL	↑ +34.8 col/100mL
Ammonia	↓ -0.023 mg/L	↓ -0.033 mg/L	No Trend	No Trend	↓ -0.011 mg/L	↓ -0.010 mg/L
Total Nitrates and Nitrites	No Trend	No Trend	No Trend	↓ -0.030 mg/L	No Trend	No Trend
Total Kjeldahl Nitrogen	↓ -0.029 mg/L	↓ -0.044 mg/L	↑ +0.05 mg/L	↑+0.031 mg/L	↑+0.020 mg/L	↑+0.024 mg/L
Total Phosphorus	No Trend	↓-0.05 mg/L	↓ -0.007 mg/L	↓0.010 mg/L	No Trend	No Trend

Note: The dissolved Oxygen trends displayed here are independent of changes in water temperature, via regression of dissolved oxygen and temperature. The nutrient trends displayed here are trends in concentration only. No loading analysis was done.

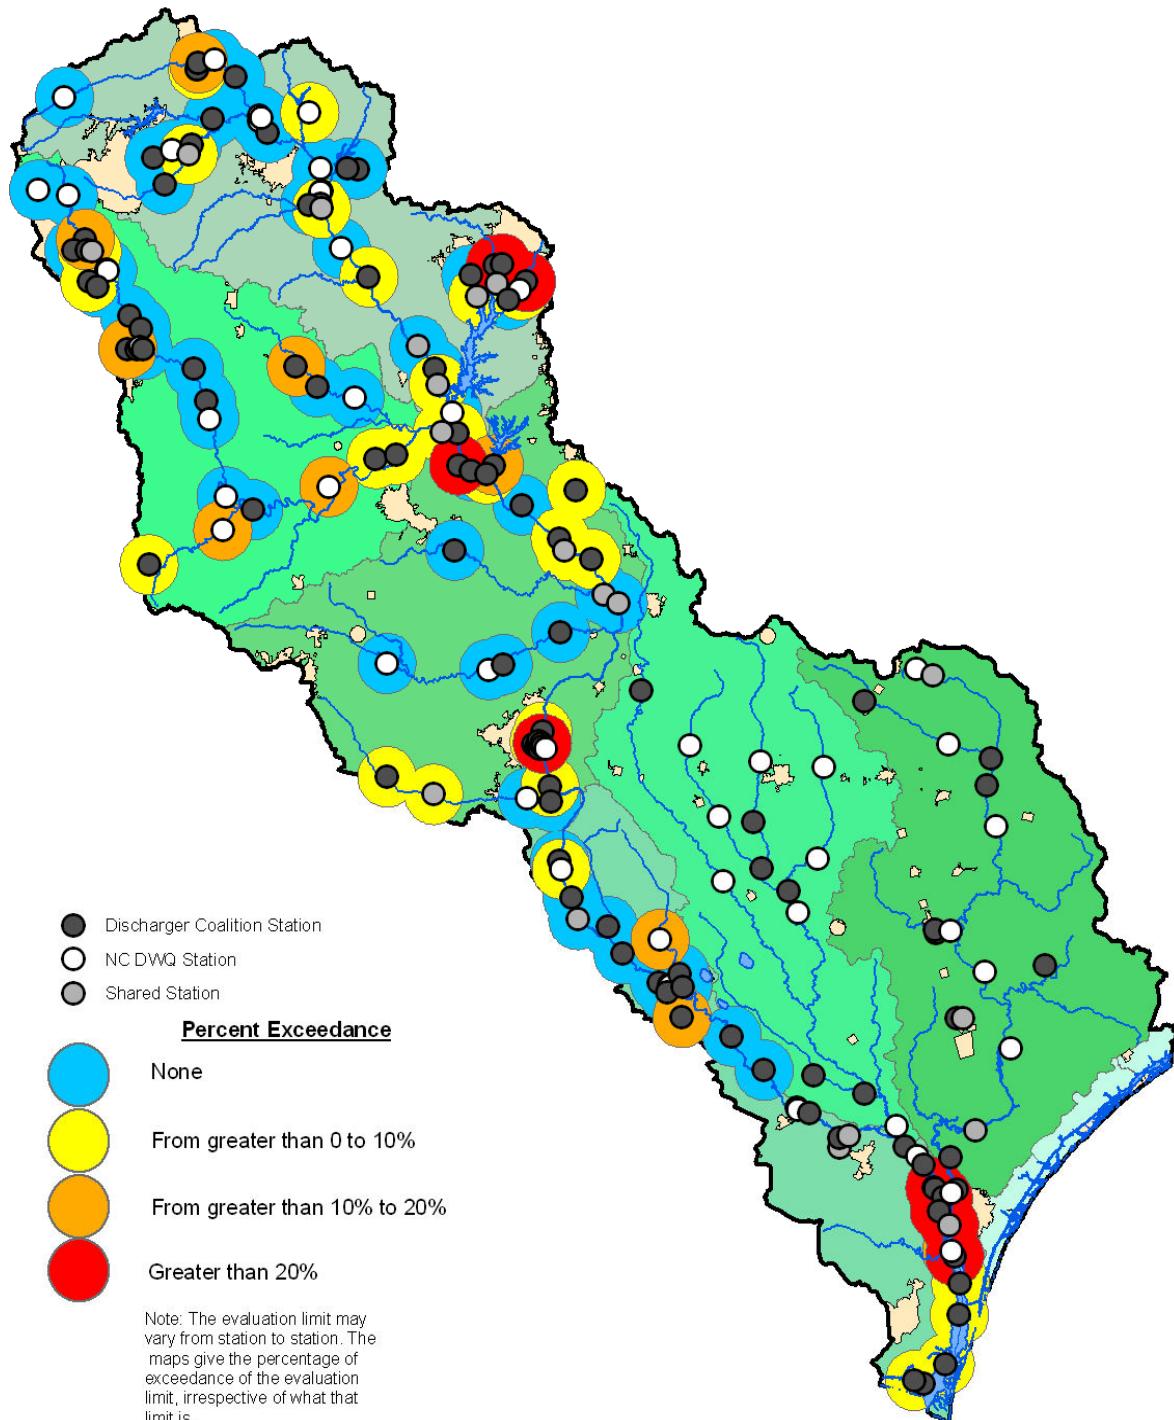

Based on these trends, the following summary statements are made:

- HU 03030002: Reductions in nutrients and fecal coliform suggest IMPROVING conditions. Changes in dissolved oxygen and pH at the levels indicated are a neutral indicator, given that the conditions are near normal.
- HU 03030003: Reductions in nutrients, fecal coliform, chlorophyll a, and specific conductance suggest IMPROVING conditions. Changes in dissolved oxygen at the levels indicated are a neutral indicator, given that the conditions are near normal.
- HU 03030004: Increases in fecal coliform suggest WORSENING conditions. Nutrient data is inconclusive. Total kjeldahl nitrogen (TKN) trends may be due to addition of a single station in 2005, and total phosphorus data shows slight reductions.
- HU 03030005: A drop in dissolved oxygen and an increase in TKN suggest WORSENING conditions. Nitrate and phosphorus data is inconclusive, as the drops are coupled with an increase in kjeldahl nitrogen, which may suggest an increase in algae.
- HU 03030006: Increases in specific conductance, fecal coliform, and TKN suggest WORSENING conditions. Reductions in ammonia are inconclusive when taken together with increases in TKN. Fecal coliform levels, though increasing, are still lower here than in other areas of the basin.
- HU 03030007: Increases in fecal coliform and TKN suggest WORSENING conditions. Reductions in ammonia are inconclusive when taken together with increases in TKN.

Please note that this analysis includes only stream and river data, not lake data. Trends in lakes may differ significantly from trends at river stations.

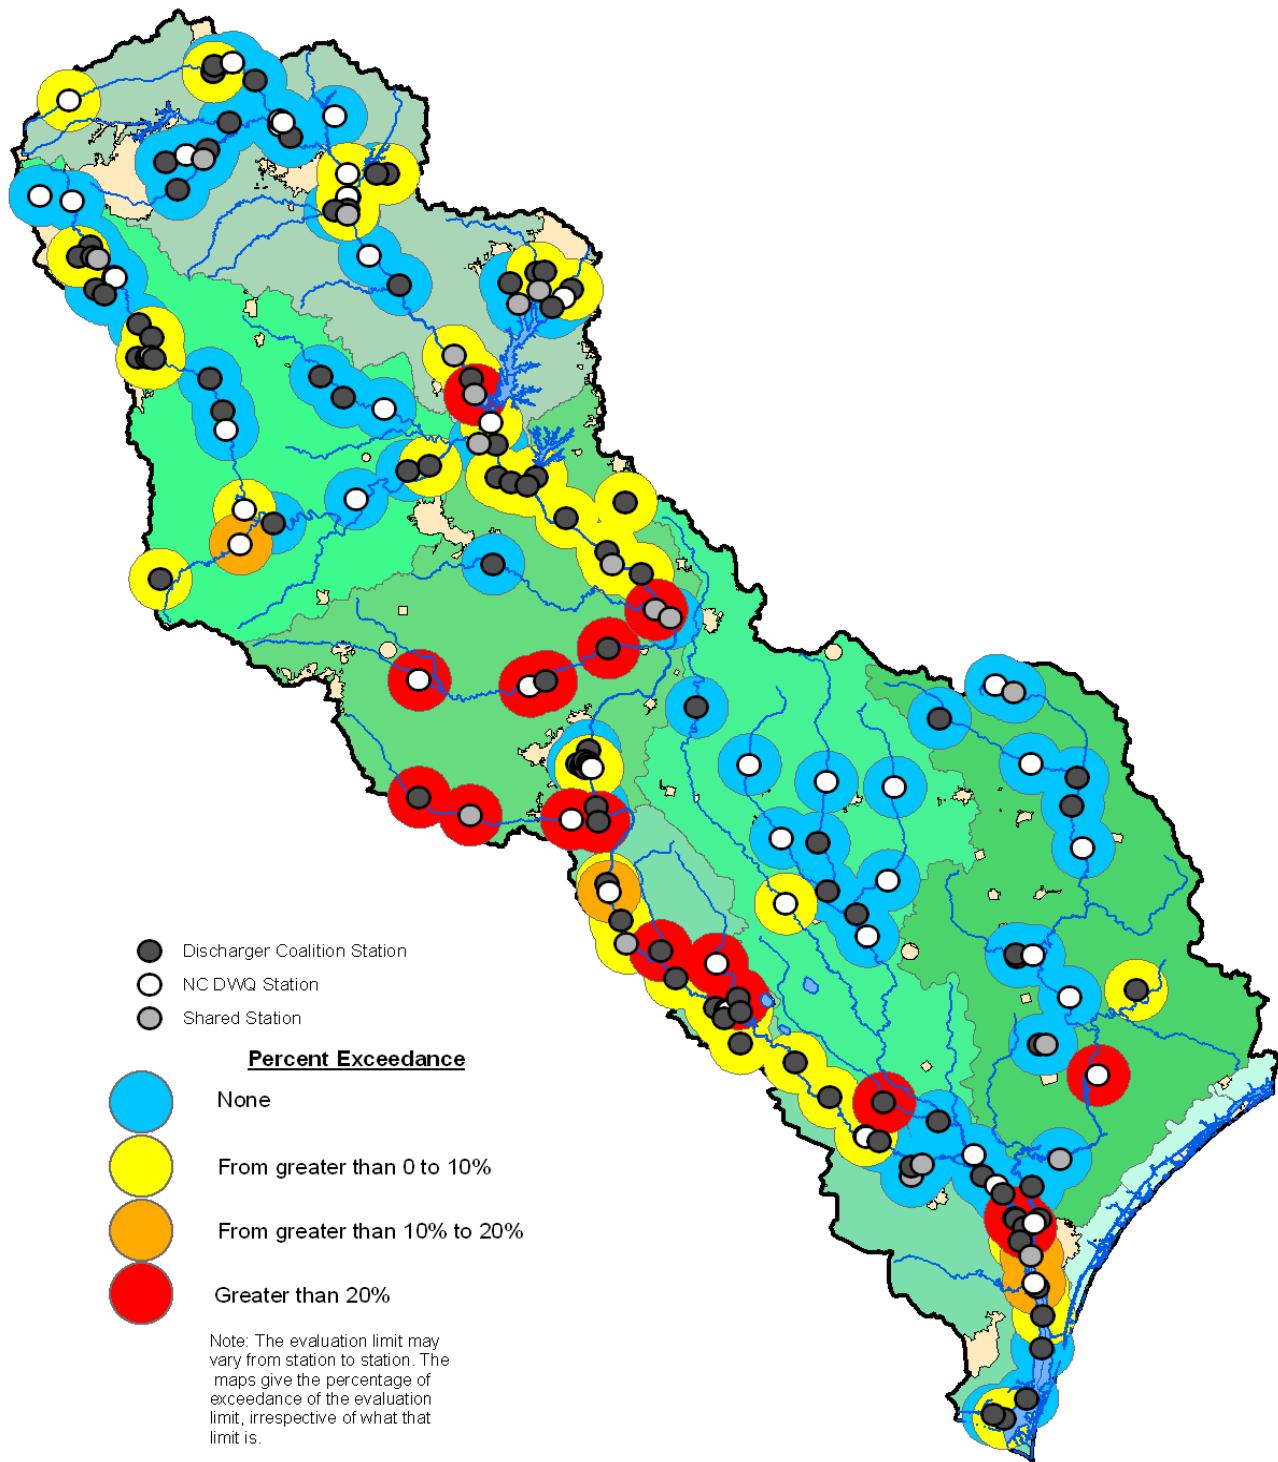

## Geographic Assessment

**Figure 11. Dissolved Oxygen in the Cape Fear River Basin**

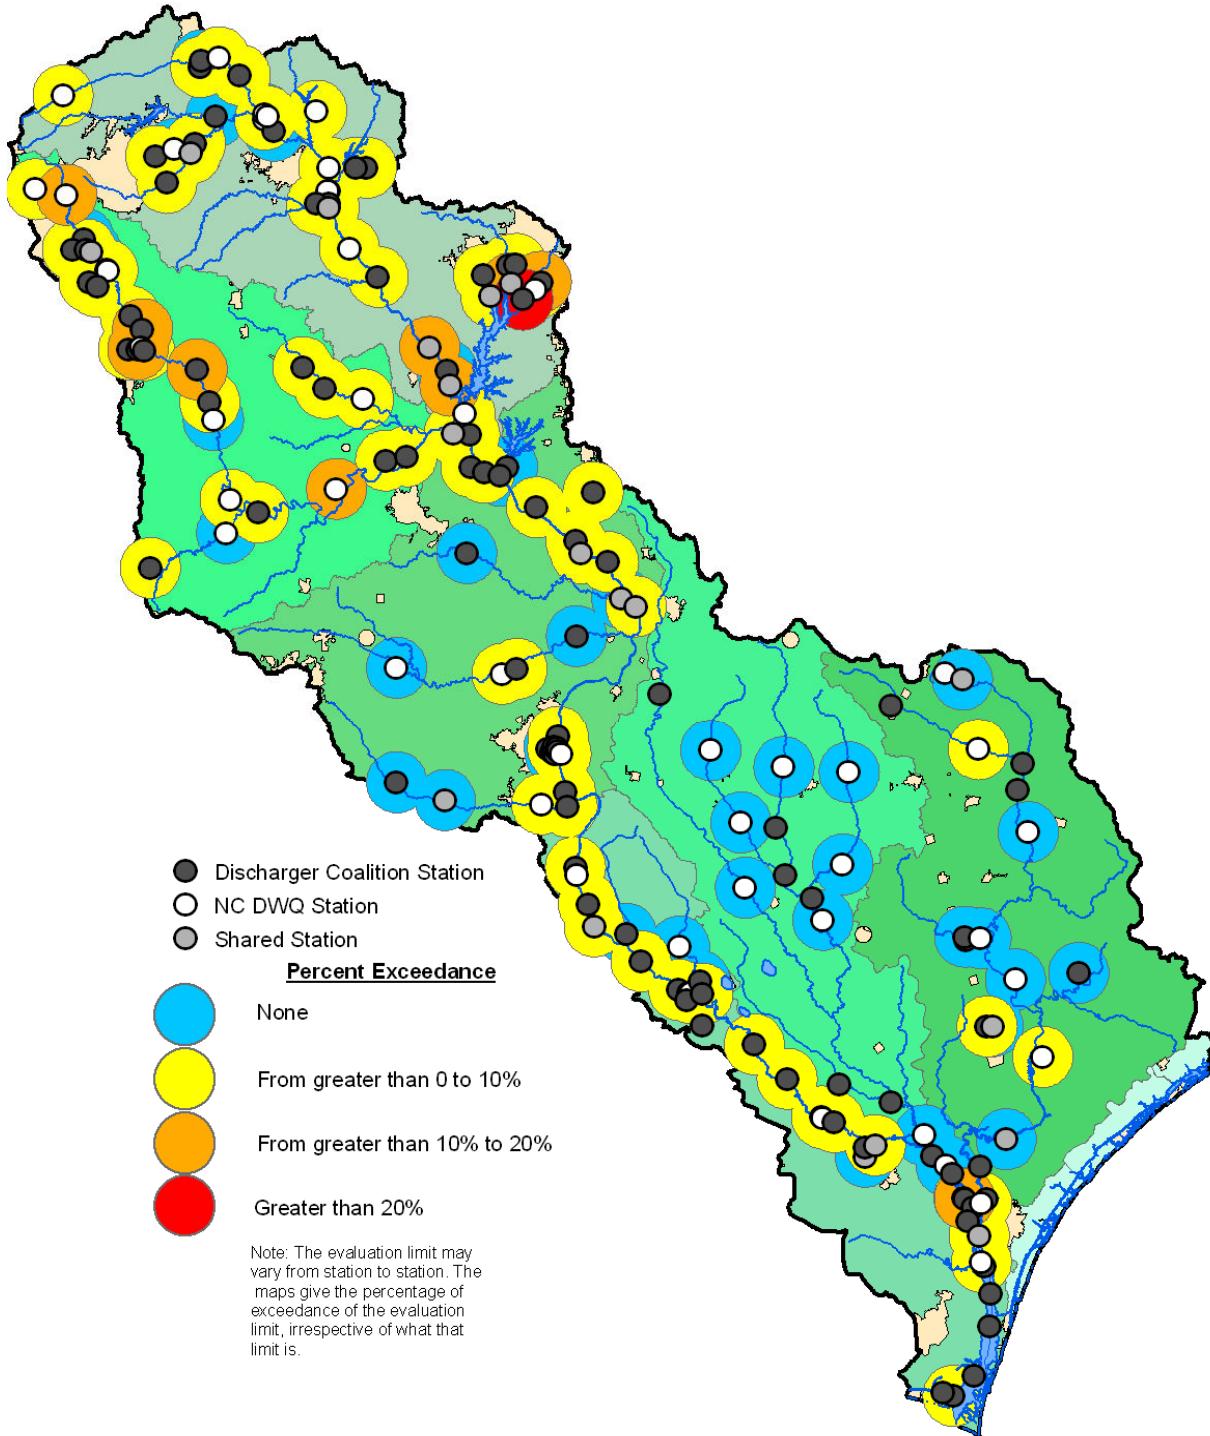

Problems with dissolved oxygen are scattered throughout the basin. Areas of particular interest are the Durham/Chapel Hill, Fayetteville, Corinth, and Wilmington areas. The Wilmington area is downstream of a large system of swamps (the Black River HU and the Northeast Cape Fear HU) and thus low dissolved oxygen may be naturally occurring.

**Figure 12. pH in the Cape Fear River Basin**

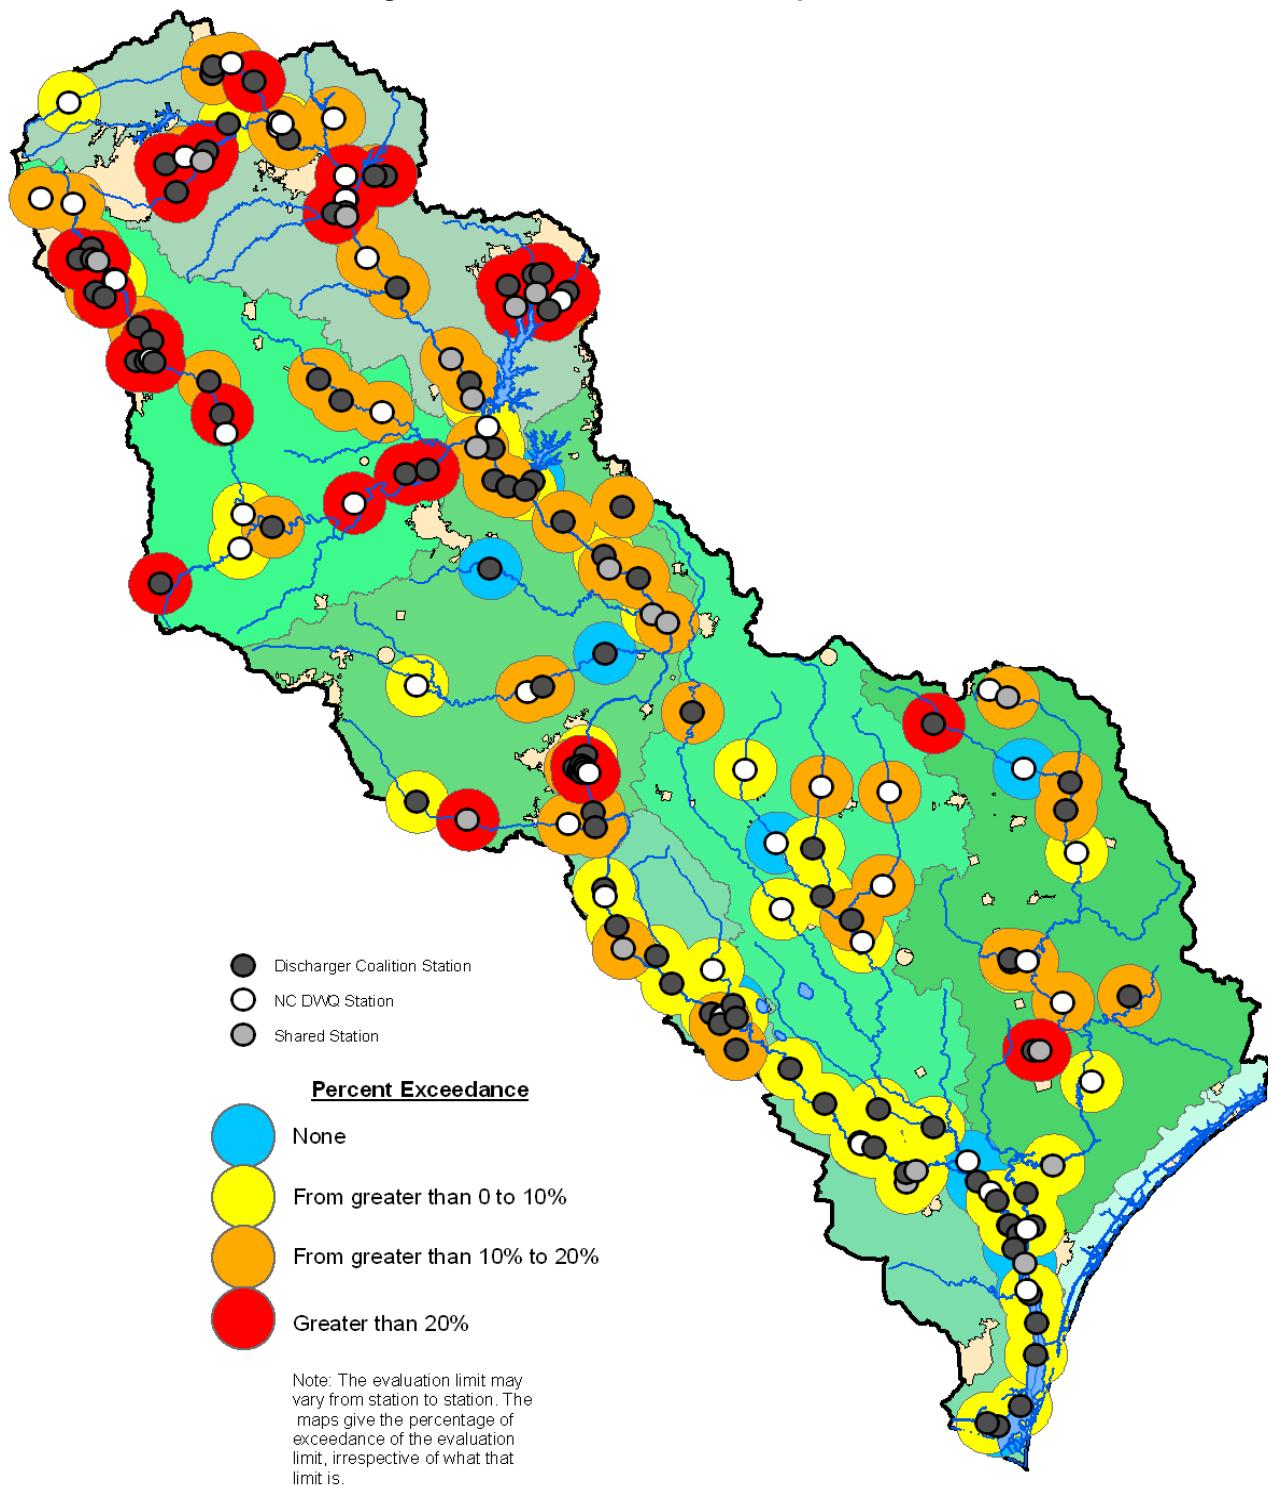

There appear to be low pH problems in several tributaries to the Cape Fear River, such as the Little River, Rock Fish Creek, Harrison Creek, and Turnbull Creek. Natural sources, such as swamp water, can cause low pH. Other possible causes include high concentrations of dissolved metals. USGS Topographic maps indicate that there may be swamp in some of these areas, despite the lack of a "swamp water" classification.

Figure 13. Turbidity in the Cape Fear River Basin

Major issues with Turbidity are not widespread in the basin. The abundance of exceedances below 10% can be caused by a few high flow events, such as rainstorms stirring up streambed sediment, and causing new sediment to be washed into the stream. Areas with insufficient vegetative buffers around streams (urban areas, areas with construction) are particularly vulnerable.

**Figure 14. Fecal Coliform in the Cape Fear River Basin**

High fecal coliform counts are nearly ubiquitous throughout the river basin. The highest incidence of exceedance appears to be focused in the northern portion of the basin, in the Deep River and Haw River HUs. Fecal Coliform are typically related to stormwater runoff from urban, suburban, or agricultural areas, but can also indicate problems with sewer or septic systems.

## **Significant Issues**

Significant issues in the basin are discussed in this section. Information on other parameters or other stations can be found in **Appendix A** (station summary sheets) and **Appendix B** (box plots). Box plots were constructed for each of the following parameters: water temperature, dissolved oxygen, pH, specific conductance, turbidity, fecal coliform, ammonia, total kjeldahl nitrogen, total nitrates and nitrites, and total phosphorus.

### **Fecal Coliform**

Sources of fecal coliform include surface runoff from livestock operations, residential areas, and urban areas. Sources also include sewer overflows, failed septic tanks, or malfunctioning wastewater treatment plants. Fecal coliform may also already be in the stream sediment, and be stirred up by heavy flow.

Fecal coliform results are screened using annual summaries of ambient sampling results. When the screenings indicate that the standard may have been violated, the standard is assessed by collecting five samples within 30 days. Priority for assessment of the standard is given to waters with Class B (recreational) uses. Some Class B waters in the Cape Fear River basin have exceeded the fecal coliform evaluation level and have been assessed for compliance with the standard. Based on the screening results, one station was assessed for compliance with the standard from 2004 to 2008. This station (B7700000) did not violate the standard. B7700000 was tested in June of 2005, and then again in June and July of 2008. In each case, none of the samples collected exceeded the standard of 400 colonies per 100 mL.

Thirty-nine stations out of 197, or 20% of stations exceeded the screening evaluation limit of 400 colonies per 100 mL over 20% of the time (see **Table 5**). Seventeen of them also exceeded a fecal coliform geomean 200 colonies per 100mL (see **Table 6**). Seventeen of those stations are also considered to have SSEs.

### **pH**

The second most common exceedance of evaluation limits is for pH. Twenty-five out of 197 (13%) in the basin have exceeded the evaluation level more than 10% of the time. Twenty of these are considered SSEs. The two areas of most concern are the Little River and Rockfish Creek, which together account for 10 of the 25 impacted stations and nine of the 20 SSEs. These two water bodies together drain most of the Fort Bragg military reservation. Metal from artillery and firing ranges is a potential source of low pH water; therefore it is a potential cause here. The source may also be natural as there are swamps in the area. Areas designated as swamp must meet a lower, less stringent pH standard of 4.3 SU. Despite this, there are two swamp stations that still exceeded the evaluation limit, B8981000 and B9550000. This may indicate impacts in these areas.

### **Dissolved Oxygen**

Twenty-two out of 197 (11%) stations in the basin have exceeded the evaluation level for dissolved oxygen over the five-year time period more than 10% of the time. Low dissolved oxygen can be caused by high water temperature, lack of sunlight (preventing plants from photosynthesizing), or lack of sources, such as turbulent waters. Overabundance of algae or aquatic vegetation on the surface of a stream can cut off light to deeper water, and cause dangerously low oxygen levels for fish and other aquatic animals. Swamps often naturally have low dissolved oxygen levels and are not evaluated for dissolved oxygen.

For a stretch of the Cape Fear River from Navassa to Channel Marker 61 in Wilmington, low dissolved oxygen is a issue of note. The Cape Fear River in this area is not classified as swamp. But in this stretch are the mouths of the Black River and the Northeast Cape Fear River. Both of those river systems contain large areas of swamp. Seven stations in this stretch of the Cape Fear have SSEs for dissolved oxygen. The low dissolved oxygen of the Wilmington area Cape Fear stations may be due to the influx of swamp water and not for any local reason.

EL: Evaluation Level; applicable numeric or narrative water quality standard or action level

Results not meeting EL: number and percentages of observations not meeting evaluation level

%Conf : States the percent statistical confidence that the actual percentage of exceedances is at least 10% (20% for Fecal Coliform)

Stations with less than 10 results for a given parameter were not evaluated for statistical confidence

# results:	Geomean		# > 400:	% > 400:	%Conf:							
59	127		6	10								

**Key:**

# result: number of observations

# ND: number of observations reported to be below detection level (non-detect)

EL: Evaluation Level; applicable numeric or narrative water quality standard or action level

Results not meeting EL: number and percentages of observations not meeting evaluation level

%Conf : States the percent statistical confidence that the actual percentage of exceedances is at least 10% (20% for Fecal Coliform)

Stations with less than 10 results for a given parameter were not evaluated for statistical confidence

**Fecal Coliform Screening(#/100mL)**

# results:	Geomean	# > 400: % > 400: %Conf:
58	118	2            3

**Key:**

# result: number of observations

# ND: number of observations reported to be below detection level (non-detect)

EL: Evaluation Level; applicable numeric or narrative water quality standard or action level

Results not meeting EL: number and percentages of observations not meeting evaluation level

%Conf : States the percent statistical confidence that the actual percentage of exceedances is at least 10% (20% for Fecal Coliform)

Stations with less than 10 results for a given parameter were not evaluated for statistical confidence

# results: Geomean # > 400: % > 400: %Conf:

55            27            0            0

**Key:**

# result: number of observations

# ND: number of observations reported to be below detection level (non-detect)

EL: Evaluation Level; applicable numeric or narrative water quality standard or action level

Results not meeting EL: number and percentages of observations not meeting evaluation level

%Conf : States the percent statistical confidence that the actual percentage of exceedances is at least 10% (20% for Fecal Coliform)

Stations with less than 10 results for a given parameter were not evaluated for statistical confidence
